

## Enhancements

- **International currencies for deal size:** Litera Transact now supports AUD, CAD, EUR, and GBP as deal currencies in addition to USD. The currency is selected in the deal creation wizard and can also be adjusted in the Edit Deal dialog. As a result of these additional currencies, the deal size report chart is no longer available. This is because Litera Transact will not continuously update currency exchange rates to support an accurate graph of this type.
- **Responsible Parties limit increase:** Users can now assign more than two responsible parties to checklist documents and add as many responsible parties as needed for enhanced collaboration.
- **iManage v2 API support:** The new support for iManage v2 API means that Litera Transact can now directly integrate with iManage Cloud and with iManage Work 10.2 and above installed on-premise.
- **Trusted login for iManage users:** Previously, when a user logged into Litera Transact using SSO, the user would still have to log into iManage (using the same SSO credentials). Now Litera Transact recognizes a user's SSO credentials and there is no need to enter them again. All the user needs to do is click **Link to iManage** in **Account Settings > Integrations**.

## Issues Fixed

- An issue with the export signature tracker has been fixed to ensure that signers are ordered alphabetically across the top of the Excel export for easy review and reference.
- An issue with the iManage search functionality has been fixed to ensure users can search and navigate their iManage documents effectively.
- The first user added to a new law firm organization is now correctly set up with entity admin permissions set. This ensures that the user can set up their organization's settings and add other entity admins as needed.
- Various performance and stability improvements.
