

## Enhancements

- **Scaled signature areas to support large deals and faster speeds:** The signature areas of Litera Transact, such as the signature tracker, the signature blocks tab, the Send All Packets dialog, are paginated so the user can scroll through pages when there are multiple signers. This means deals can now support up to 500 signers and the speed and presentation of signer information is smooth and efficient.
- **Review all signature blocks:** Users can now review all of a deal's signature blocks in a single view to check that the information is accurate and all necessary signers are included. Access is from the **Review All Blocks** button (available from both the Single Entry and the Table Entry tabs) and signature blocks are organized by group. Users can search and filter by signer name, additional signer name, signing entity and additional signing entity.
- **Test deals:** Users can now designate a deal as a test deal to allow for easier testing and training. When users indicate that a deal is a test deal, the word TEST is added to the name of the deal.
- **Deal settings:** The deal settings now appear in their own **Deal Settings** page to make them easily accessible for each deal. The close deal functionality is now included in the settings so users can change the status of a deal from open to closed.
- **Rebranded product to Litera Transact:** The branding of the Litera Transact application, including the URLs has been updated. All Doxly references have been removed and the interface is consistent and modern helping to create comfort and certainty within deal processes. Users will notice a new top bar, which has a dark or light theme that can be set by the entity admin, centralized content on pages and a rebranded browser icon and tab description. Additionally, system emails have been rebranded and URLs updated as follows:
  - app.litera.work (U.S. instance)
  - app.eu.litera.work (Europe instance)
  - app.uk.litera.work (U.K. instance)
  - app.au.litera.work (Australia instance)
  - app.sg.litera.work (Singapore instance)
- **New Litera Transact location:** A new instance of Litera Transact is now available in Canada at **app.ca.litera.work**. This adds to our existing locations in the U.S., London, Frankfurt, Sydney and Singapore. Deals that are created in these instances store 100% of the data (including all files) in the relevant location.

## Issues Fixed

- The default tab in the Signatures > Blocks page is now Single Entry as users prefer to add signature blocks through the single entry method.
- iManage files are now consistently getting the correct file-naming, versioning and time-stamping.
- Various performance and stability improvements.
